	- Country:	Portugal		
Dates:	From:	2016-07-17 To:	2016-07-22 and 2016-08-01 To:	2016-08-06
	Nr. of days:	15		
Budget:	1875,00 Euro			

1. SUMMARY OF STSM

The National Laboratory of Energy and Geology (LNEG), choice as host institution for my STSM, has a large research experience in energy in buildings, NZEB, façade elements and heat transfer, and it promotes façade design and engineering at a European level and beyond. In such context, the Energy Efficiency Unit develops in particular its activity in the energy efficiency field, acting in two particular sectors: the 'Building' (households, offices) and the 'Industry' sectors, with a particular focus on:

- Technologies, processes and products development, in close cooperation with the companies which are active in the Portuguese Economy;
- Advanced training and dissemination in specific fields;
- Energy efficiency in buildings by the integration of active and passive technologies in buildings, renewable energy systems, and prefabricated systems for building facades integration;
- New concepts: Net Zero Energy Buildings (NZEB) and Smart Cities;
- Audits in Building;
- EcoDesign and Design for Sustainability (products, processes) - The design of products that affect energy consumption, in a life cycle perspective, along with the communication to the market of its characteristics and functionalities;
- Etc...

Fig. 1. The Adaptive South façade of Edificio Solar XXI LNEG in Lisbon

The possibility to collaborate during my STSM programme of the Cost Action TU4013 with the team of international expert of National Laboratory of Energy and Geology (LNEG), coordinated by prof. Laura Aelenei, has allowed me to improve my knowledge in the field of the existing research about the evolution of smart façade systems in the area of design and industrial production and to start an interesting collaboration with the Working Group 1 of the COST ACTION that I hope continuing in the future.

2. OBJECTIVES OF THE STSM

My STMS has been focused to know the research methodologies adopted in the research Group of LNEG in order to investigate the technological, functional and qualitative standards of dynamic façades and evaluate the energy performances of the building envelope as a dynamic system that interacts between indoor and outdoor environment.

The activities developed during my two weeks in Lisbon have been focused in particular to increase my knowledge in the frame of responsive/adaptive/interactive building envelopes working with the prof. L. Aelenei on the construction of an adaptive façade characterization matrix, based on: state of the art, database of different applications, projects developed in this area which could be a useful tool for developing new adaptive façade design and technologies.

The objectives of my STMS programme have been those following listed:

1. To analyse the state of art of the dynamic façade systems for the hot and temperate climate, contributing to map out these types of adaptive façades with the objective to increase the activity started in the WG1 with the creation of a supporting database.
2. To collect information from literature and case studies to build a new definition regarding adaptive facade that will be used for starting a new publication (already planned regarding specifically to the definitions).
3. To enhance the knowledge on novel materials, concepts and technologies and/or the new combinations of existing technologies for adaptive envelope, as indicated in the task 1.4 of WG1
4. To contribute to Annual Training School for dissemination of expertise to Early Stage Researchers

3. DESCRIPTION OF THE WORK CARRIED OUT DURING THE STSM (ACCORDING WITH THE DESCRIBED OBJECTIVES)

The goal of my STSM has been increasing my scientific experience through the exchange of knowledge within the working group of Prof. Laura Aelenei where a multidisciplinary team of architects and engineers work with specific expertise in the field of energy in buildings, architectural building integration of renewable energy systems and technology, developing interesting researches on the scientific area of building envelope.

The work that I have carried out at the host institution, during the two weeks of STSM, have been focused in particular on the following main specific activities:

3.1 ANALYSIS OF THE STATE OF ART OF THE ADAPTIVE FACADES (D1.1), contributing to map out these types of adaptive façades (available either on the market, or as prototypes or concepts) with the objective to increase the activity started in the WG1 with the creation of a supporting database of different technological solutions and applications of adaptive facades, characterized by a matrix of influencing parameters. In particular I worked to the design of a new datasheet to collect the information on the adaptive façades analysed in the first part of the research activities COST. Furthermore I have integrated the database with other case studies of adaptive envelopes located in the temperate climate.

Fig. 3. A first draft of Datasheet developed for the COST database

3.2 STARTING DEVELOPMENT OF A NEW DEFINITIONS OF ADAPTIVE FACADE based on the state of the art and survey analysis that will be used for starting a new publication (already planned regarding specifically to the definitions). (D1.2)

Adaptive, in fact is only one designation for a concept that is described by a multitude of different terms. Even within the discipline of architecture, terms such as “smart”, “intelligent”, “interactive”, “adaptive” or “responsive” have been used loosely and interchangeably, creating confusion as to their specific meaning and their conceptual relationship to building performance and design. In response, during my STSM I have worked to build a provisional lexicon of descriptive, behavioural and methodological terms to assist researchers and designers in navigating the field of high-performance skins that incorporate materially innovative and feedback-based systems. It offers a brief overview of current advances in this nascent and rapidly evolving field and articulates a broader conceptual territory for the term “adaptive”; one that is able to interact with the environment and the user by reacting to external influences and adapting their behaviour and functionality accordingly: the building envelope insulates only when necessary, it produces energy when possible, it shades or ventilates when the indoor comfort so demands.

3.3 FIRST REVIEW OF MATERIAL PREPARED FOR ANNUAL TRAINING SCHOOL (D 1.6) for dissemination of expertise to Early Stage Researchers with a construction of an “Adaptive façade Syllabus” based on the state of the art and survey analysis to use during the working sessions in order to provide a systematic characterization of the adaptive façade for future trends of adaptive facades design, development of novel adaptive technologies.

The image displays a comprehensive datasheet template for the COST database, organized into several key sections:

- CASE STUDY NAME:** Includes fields for Building Location, Year of Construction, and Main Author/Group.
- KEYWORDS DEFINING THE CASE STUDY:** A section for defining the study's scope and focus.
- DETAILED DESCRIPTION OF THE CASE STUDY SYSTEM:** This section is divided into multiple sub-sections:
 - TECHNOLOGY RESEARCH (LVL):** Lists various technologies and their application.
 - TYPE OF FACADE SYSTEM:** Provides a classification for the facade system.
 - FUNCTIONAL GOAL (PURPOSE):** Details the intended functional goals of the facade.
 - TYPE OF COMPONENT:** Specifies the components used in the facade system.
 - TYPE OF OPERATION (OUTPUT):** Describes the operational characteristics and outputs.
- CONTROL OPERATION DETAILS:** Includes a visual representation of the facade and a detailed explanation of its control system.
- ECONOMICAL ASPECTS:** A section for detailing the economic aspects of the facade system, including cost estimation and references.

Fig. 4. A second draft of Datasheet developed for the COST database

4. OTHER ACTIVITIES:

- To know the research activities of LNEG and in particular those dedicated to project, test and prototype innovative façade systems. During my two weeks of STMS, in fact, I could visit the LNEG Campus and its innovative buildings. In particular I worked inside the experimental Edificio Solar XXI, so to analyse the interesting technologies that have been adopted to reduce the energy consumptions for heating and cooling during all months of the year and to know the adaptive façade systems with the integration of an innovative PCM, that is tested in these months in the south façade of this building.
- To Acquire new skills on novel materials, technologies and new combinations of existing technologies for adaptive Facades in order to provide a selection of technologies applications already adopted in existing projects, identifying the strongest and weakest points, and to pursue new concepts and new products for adaptive façades;
- To develop new knowledge such as effective evaluation tools to analyse the energy performances of the multilayers and smart facades

5. OUTCOME

The outcome of my STSM have been:

- The STSM has contributed to a deliverable described in the [MoU of the Action](#)
 - Report and database with current state-of-the-art adaptive façade materials, systems and new concepts
 - Report on real world case studies of adaptive façade applications.
 - Report on progress made in new adaptive technologies over the course of the Action.
 - Contribution to Annual Training School for dissemination of expertise to Early Stage Researchers
- The STSM results in a joint journal/conference publication

As the min contribution is the structure of definitions regarding adaptive façade based on the state of the art and survey case studies analysis, the results of this STSM will be used also for starting a new publication (already planned regarding specifically to the definitions)

- The STSM results in a joint research proposal

Opportunities for joint participation in H2020 proposal were analysed, in particular those relative to the calls regarding the adaptive envelopes (i.e. EE02 Energy-efficient Buildings; EE14 Construction skills; EE03 Standardised

installation packages integrating renewable and energy efficiency solutions for heating, cooling and/or hot water preparation, etc.).

6. BENEFITS OF THE STSM

The relationships that I have developed during the STMS with other researchers employed in the field of design and test of adaptive envelopes allowed me to improve my knowledge and transferring this in my research and in the following activities developed into the COST Action TU1403:

- Editing of reports on: current adaptive facades modelling techniques; current state-of-the-art adaptive façade materials, systems and new concepts; real world case studies of adaptive façade applications; progress made in new adaptive technologies over the course of the Action; etc.
- Input and contributions to relevant parts of educational pack into WG1
- Teaching activity in Annual Training School, Education Pack and Industry Workshops, etc.

Moreover, the possibility to transfer knowledge between two research centres and to compare two different scientific approaches could accelerate the development of new international researches on innovative components and evaluation techniques, and their adoption and application in buildings located in South Europe.
